

# CartTools®

## User-friendly Configuration Tool

## Automatic Guided Vehicles

CartTools® is a comprehensive user-friendly configuration tool created for use with our Automatic Guided Vehicles.

Originally created in the year 2000, CartTools was born from the desire to allow simple system implementation and enable system caretakers to “own” their vehicles.

The CartTools framework has allowed continued functional growth of our product lines.

Daifuku is one of the largest AGV manufacturers in the world.

### FEATURES:

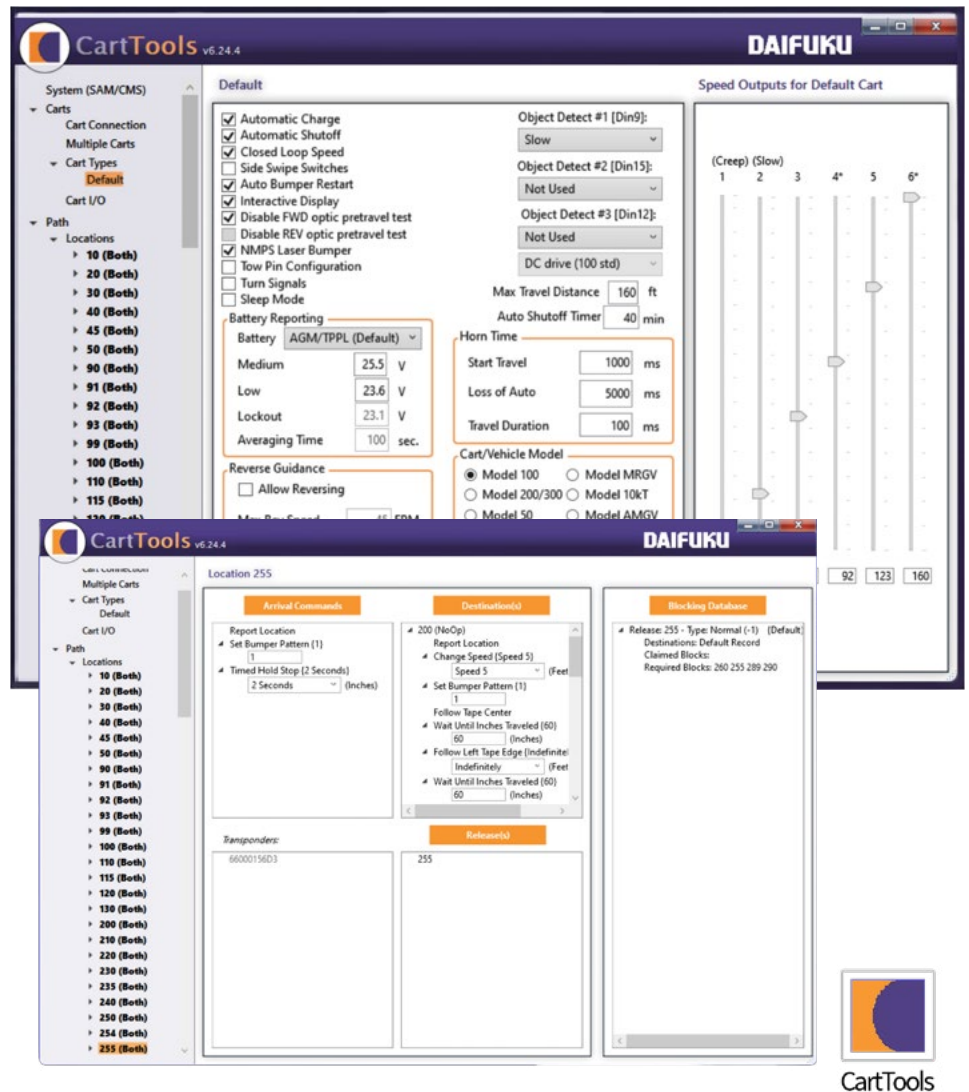

**Standardized Command Menus** – Standard commands are presented in selectable pick lists, allowing the user to create lists of commands that are executed in exact order. Commands have been broken down to allow maximum detailed control.

**Location and Destination Activated Functions** – Command lists can be triggered based on where a vehicle is and where it is going.

Facilitates Firmware Upgrades to our Cart Control Unit boards that “run” our vehicles.

**Traffic Management Declarations** - SAM offers traffic management. CartTools is the tool where the traffic rules are declared.

**Communications Declaration** - The command files can be loaded directly to vehicles via CartTools or with our System Automation Manager (SAM) software. SAM provides the automatic download of the latest CartTools files to the vehicles, ensuring offline vehicles get the latest files when inserted in the system.

### OPERATING SYSTEM REQUIREMENTS:

Windows 10 • Windows 11 • Windows Server 2019 • Windows Server 2022
